# Executive Summary

Directive 96/62/EC on Ambient Air Quality Assessment and Management (the Framework Directive) establishes a framework under which the EU sets limit values or target values for the concentrations of specified air pollutants. Directive 2002/3/EC (the third Daughter Directive) sets Target Values (TVs) and Long-term Objectives (LTOs) to be achieved for ozone.

2006 is the third year for which an annual air quality assessment for the third Daughter Directive pollutants is required. A questionnaire has been completed for submission to the EU containing the results of this air quality assessment along with those required for the first and second Daughter Directives. The assessment takes the form of comparisons of measured and modelled air pollutant concentrations with the Target Values and Long-term Objectives set out in the Directives. Air quality modelling has been carried out to supplement the information available from the UK national air quality monitoring networks.

This report provides a summary of key results from the questionnaire and additional technical information on the modelling methods that have been used to assess the levels of ozone throughout the UK. This includes:

- Details of modelling methods
- Information on the verification of the models used and comparisons with data quality objectives (DQOs)
- Detailed modelling results and comparison with Target Values and Long-term Objectives.

Maps of background ozone concentrations in 2006 on a 1 km x 1 km grid have been prepared for the UK. The following metrics set out by the third Daughter Directive have been modelled:

- Number of days above  $120 \mu\text{g m}^{-3}$  in 2006
- Number of days above  $120 \mu\text{g m}^{-3}$  per year averaged over three years 2004-2006
- AOT40 wheat crops in 2006
- AOT40 wheat crops averaged over five years 2002-2006

The models used in this assessment have been selected based on a critical appraisal of the techniques available within the UK.

The UK has been divided into 43 zones for air quality assessment. There are 28 agglomeration zones (large urban areas) and 15 non-agglomeration zones. An assessment of measured levels of ozone in is also presented in this report. Gibraltar is comprised of a single non-agglomeration zone for which no modelling assessment has been undertaken but data from an automatic monitoring campaign is presented in this report. The exceedence status of the zones in the UK has been determined from a combination of monitoring data and model results. The exceedence status of the Gibraltar zone has been determined from monitoring data only. The results of the UK assessment are summarised in Tables E1 and E2 in terms of exceedences of Target Values (TV) and Long-term Objectives (LTO). Corresponding results for Gibraltar based on monitoring data only are presented in Tables E3 and E4.

**Table E1 UK summary results of air quality assessment relative to the Target Values for ozone for 2010**

<i>Target Value</i>	<i>Number of zones exceeding</i>
Max Daily 8-hour mean Target Value	none
AOT40 Target Value	none

**Table E2 UK summary results of air quality assessment relative to the Long-term Objectives for ozone**

<i>Long-term Objective</i>	<i>Number of zones exceeding</i>
Max Daily 8-hour mean Long-term Objective	43 zones (41 measured + 2 modelled)
AOT40 Long-term Objective	41 zones (32 measured + 9 modelled)

**Table E3 Gibraltar summary results of air quality assessment relative to the Target Values for ozone for 2010**

<i>Target Value</i>	<i>Number of zones exceeding</i>
Max Daily 8-hour mean Target Value	none
AOT40 Target Value	none

**Table E4 Gibraltar summary results of air quality assessment relative to the Long-term Objectives for ozone**

<i>Long-term Objective</i>	<i>Number of zones exceeding</i>
Max Daily 8-hour mean Long-term Objective	1 zone (measured)
AOT40 Long-term Objective	1 zone (measured)

# 1 Introduction

## 1.1 THE FRAMEWORK AND DAUGHTER DIRECTIVES

Directive 96/62/EC on Ambient Air Quality Assessment and Management (the Framework Directive (Council Directive 96/62/EC)) establishes a framework under which the EU sets limit values or target values for the concentrations of specified air pollutants in ambient air. Directive 1999/30/EC (the first Daughter Directive, AQDD1) sets the limit values to be achieved for sulphur dioxide, nitrogen dioxide and oxides of nitrogen, particles and lead. Directive 2000/69/EC (the second Daughter Directive, AQDD2) sets limit values to be achieved for benzene and carbon monoxide. Directive 2002/3/EC (the third Daughter Directive, AQDD3) sets Target Values (TVs) and Long-term Objectives (LTOs) to be achieved for ozone.

The Framework Directive includes a requirement for Member States to undertake preliminary assessments of ambient air quality, prior to the implementation of the Daughter Directives under Article 5 this Directive. The objectives of these assessments are to establish estimates for the overall distribution and levels of pollutants, and to identify additional monitoring required to fulfil obligations within the Framework Directive. Reports describing the preliminary assessment for the UK for AQDD1, AQDD2 and AQDD3 have been prepared<sup>1,2,3,4</sup>. The Daughter Directives define the number of air quality monitoring sites required on the basis of the concentrations of pollutants and population statistics. The number of monitoring sites required is significantly reduced if other means of assessment, in addition to fixed monitoring sites, are also available. Air quality modelling has therefore been carried out to supplement the information available from the UK national air quality monitoring networks and contribute to the assessments required by the Framework and subsequent Daughter Directives. Obligations for assessments in Gibraltar are entirely fulfilled by measurements.

## 1.2 THIS REPORT

The first and second Daughter Directives make provision for an annual air quality assessment for NO<sub>2</sub>, PM<sub>10</sub>, SO<sub>2</sub>, CO and benzene. 2006 is the third year for which an annual air quality assessment is required for ozone as specified in the third Daughter Directive. A questionnaire has been completed for submission to the EU containing the results of this air quality assessment. A copy of the completed questionnaire for the UK and Gibraltar can be found on the Central Data Repository of the European Environment Agency<sup>5</sup>. The assessment takes the form of comparisons of measured and modelled air pollutant concentrations with the limit values set out in the Directives. This report details the results of annual air quality assessments undertaken to satisfy the UK and Gibraltar's obligation under the third Daughter Directive (AQDD3) and focuses on the modelling methodology for ozone. The air quality assessments for NO<sub>2</sub>, PM<sub>10</sub>, SO<sub>2</sub>, CO and benzene are covered in a separate report<sup>6</sup> that can be found on the National Air Quality Archive.

Section 2 describes the modelling procedures used for estimation of ozone in the UK. These include:

- Information on the calibration and verification of the models
- Background ambient concentration maps
- Detailed model results and identification of modelled exceedences of TV and LTO

The following metrics relevant to the annual reporting of data to the Commission have been investigated:

- Number of days above  $120 \mu\text{gm}^{-3}$  in 2006
- Number of days above  $120 \mu\text{gm}^{-3}$  per year averaged over three years 2004-2006
- AOT40 wheat crops in 2006
- AOT40 wheat crops averaged over five years 2002-2006

The definitions of the metrics presented above and the Target Values and Long-term Objectives are given in Annex I of the Directive. In addition, Annex II of the Directive presents Alert and Information Thresholds designed to inform the public and organisations representing sensitive population groups on occasions when there is increased a risk to human health from exposure to elevated levels of ozone. Annex I and II are presented below.

Section 3 presents the exceedence status of zones in the UK in relation to the TV and LTO in 2006. These results are distinct from the modelled results presented in Section 2, as they also incorporate monitoring data from the national networks to determine the zone status.

Section 4 presents the exceedence information for Gibraltar in 2006. Information for the Gibraltar zone is limited to measured data from the continuous automatic monitoring campaign, no model output being available for Gibraltar at this time.

### **1.3 PRELIMINARY ASSESSMENTS AND DEFINITION OF ZONES**

The preliminary assessment carried for AQDD1 defined a set of zones to be used for air quality assessments in the UK based on population and urban areas data from the 1991 UK Census. These data have now been updated using information on populations from the 2001 Census and land-use data from the Devolved Administrations. Updated zones are listed in Table 1.1 and illustrated in Figure 1.1. Information on the definition of zones is included in Form 2 of the questionnaire. The zone codes listed in Table 1.1 are used throughout the questionnaire. The population and area of each zone is also shown. The zones are of two types: agglomeration zones (continuous urban areas with a population in excess of 250,000) and non-agglomeration zones. There are 28 agglomeration zones and 15 non-agglomeration zones, giving a total of 43 zones in the UK. The non-agglomeration zones in England correspond to the Government Office Regions, while those in Scotland, Wales and Northern Ireland were defined in conjunction with the Devolved Administrations.

The preliminary assessment for ozone also defined the monitoring and modelling requirements for each zone based on an assessment of concentrations in relation to TVs and LTOs specified by AQDD3. The minimum monitoring requirement for ozone and NO<sub>x</sub> in the majority of zones was found to be at least one monitoring site per zone, with the monitoring results to be supplemented with information from modelling studies.

## ANNEX I

## DEFINITIONS, TARGET VALUES AND LONG-TERM OBJECTIVES FOR OZONE

**I. Definitions**

All values are to be expressed in  $\mu\text{g}/\text{m}^3$ . The volume must be standardised at the following conditions of temperature and pressure: 293 K and 101,3 kPa. The time is to be specified in Central European Time.

AOT40 (expressed in  $(\mu\text{g}/\text{m}^3)\text{-hours}$ ) means the sum of the difference between hourly concentrations greater than  $80 \mu\text{g}/\text{m}^3$  ( $= 40$  parts per billion) and  $80 \mu\text{g}/\text{m}^3$  over a given period using only the 1 hour values measured between 8:00 and 20:00. Central European Time each day <sup>(1)</sup>.

In order to be valid, the annual data on exceedances used to check compliance with the target values and long-term objectives below must meet the criteria laid down in Section II of Annex III.

**II. Target values for ozone**

	Parameter	Target value for 2010 (a) <sup>(1)</sup>
1. Target value for the protection of human health	Maximum daily 8-hour mean (b)	$120 \mu\text{g}/\text{m}^3$ not to be exceeded on more than 25 days per calendar year averaged over three years (c)
2. Target value for the protection of vegetation	AOT40, calculated from 1 h values from May to July	$18\,000 \mu\text{g}/\text{m}^3\cdot\text{h}$ averaged over five years (c)

(a) Compliance with target values will be assessed as of this value. That is, 2010 will be the first year the data for which is used in calculating compliance over the following three or five years, as appropriate.

(b) The maximum daily 8-hour mean concentration shall be selected by examining 8-hour running averages, calculated from hourly data and updated each hour. Each 8-hour average so calculated shall be assigned to the day on which it ends, i.e. the first calculation period for any one day will be the period from 17:00 on the previous day to 01:00 on that day; the last calculation period for any one day will be the period from 16:00 to 24:00 on the day.

(c) If the three or five year averages cannot be determined on the basis of a full and consecutive set of annual data, the minimum annual data required for checking compliance with the target values will be as follows:  
— for the target value for the protection of human health: valid data for one year,  
— for the target value for the protection of vegetation: valid data for three years.

(1) These target values and permitted exceedance are set without prejudice to the results of the studies and of the review, provided for in Article 11, which will take account of the different geographical and climatic situations in the European Community.

**III. Long-term objectives for ozone**

	Parameter	Long-term objective (a)
1. Long-term objective for the protection of human health	Maximum daily 8-hour mean within a calendar year	$120 \mu\text{g}/\text{m}^3$
2. Long-term objective for the protection of vegetation	AOT40, calculated from 1 h values from May to July	$6\,000 \mu\text{g}/\text{m}^3\cdot\text{h}$

(a) Community progress towards attaining the long-term objective using the year 2020 as a benchmark shall be reviewed as part of the process set out in Article 11.

Source; Directive 2002/3/EC

ANNEX II  
INFORMATION AND ALERT THRESHOLDS

**I. Information and alert thresholds for ozone**

	Parameter	Threshold
Information threshold	1 hour average	180 µg/m <sup>3</sup>
Alert threshold	1 hour average (a)	240 µg/m <sup>3</sup>

(a) For the implementation of Article 7, the exceedance of the threshold is to be measured or predicted for three consecutive hours.

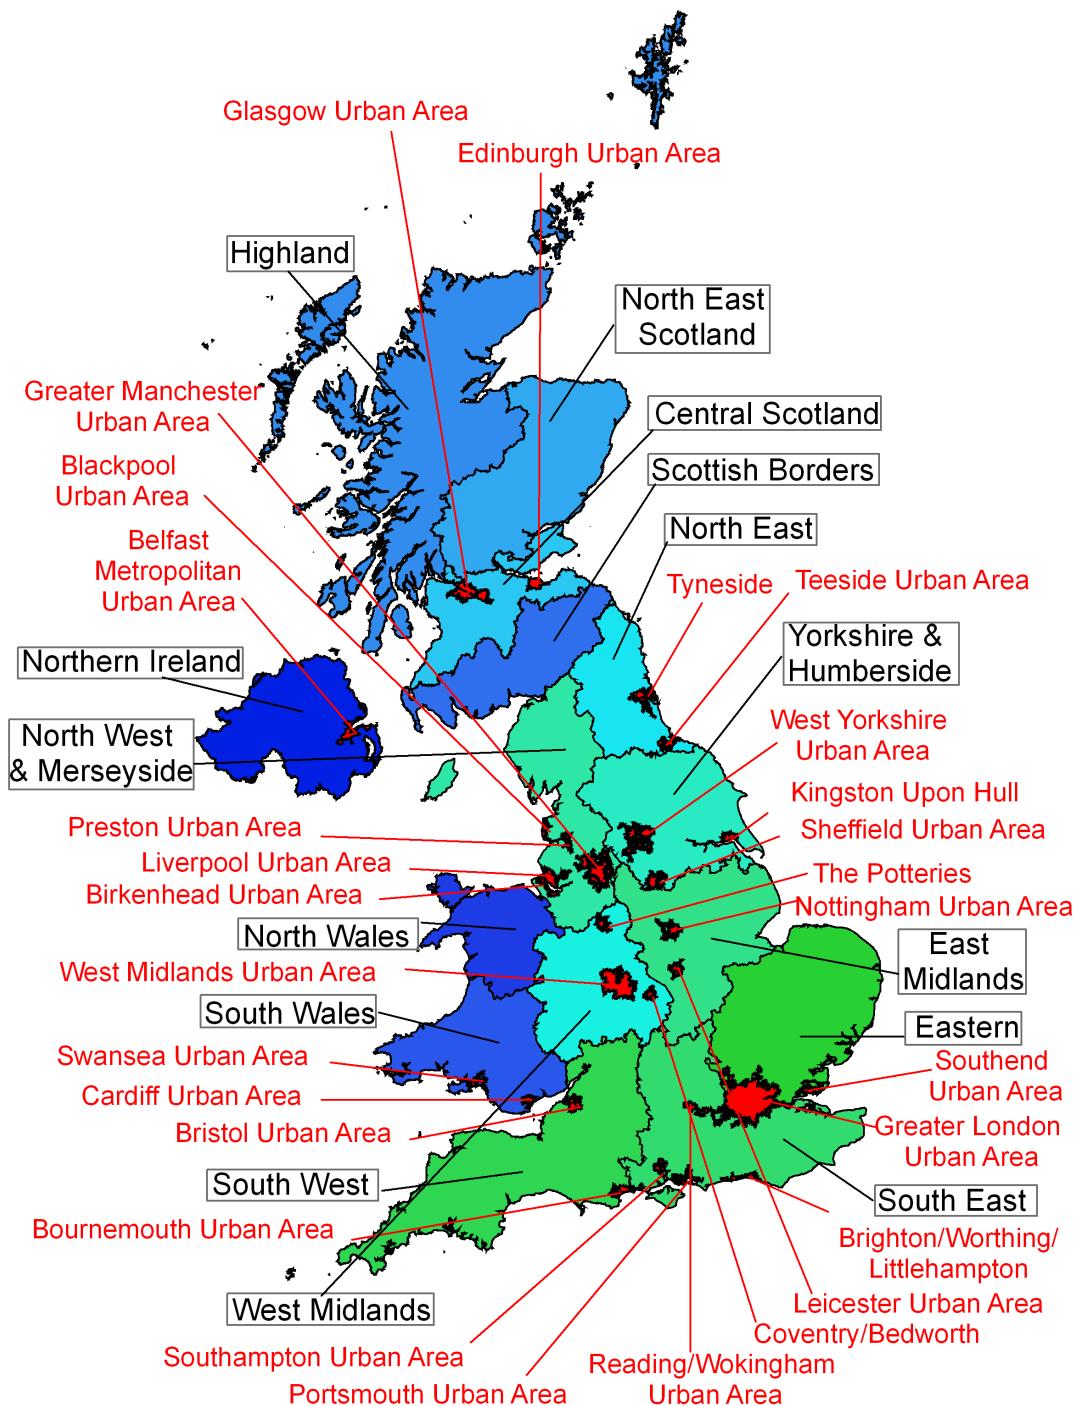

**II. Minimum details to be supplied to the public when the information or alert threshold is exceeded or exceedance is predicted**

Details to be supplied to the public on a sufficiently large scale as soon as possible should include:

1. information on observed exceedance(s):
  - location or area of the exceedance,
  - type of threshold exceeded (information or alert),
  - start time and duration of the exceedance,
  - highest 1-hour and 8-hour mean concentration;
2. forecast for the following afternoon/day(s):
  - geographical area of expected exceedances of information and/or alert threshold,
  - expected change in pollution (improvement, stabilisation or deterioration);
3. information on type of population concerned, possible health effects and recommended conduct:
  - information on population groups at risk,
  - description of likely symptoms,
  - recommended precautions to be taken by the population concerned,
  - where to find further information;
4. information on preventive action to reduce pollution and/or exposure to it:
  - indication of main source sectors; recommendations for action to reduce emissions.

## 1.4 MONITORING SITES

The monitoring stations operating during 2006 in the UK and Gibraltar for the purpose of AQDD3 are listed in Table A1.1 and A1.2 in Appendix 1. This information is included in Form 3 of the questionnaire. Not all sites had sufficient data capture during 2006 for data to be reported in the questionnaire. The data quality objective (DQO) for AQDD measurements is 90% data capture. We have included all measurements with at least 75% data capture in the UK modelling analysis in order to ensure that we can make maximum use of data from the monitoring sites operational during 2006 for reporting purposes. Table A1.3 in Appendix 1 lists the data capture rates for all monitoring stations used in the calibration of models for reporting under AQDD1-3.

Measurement data from monitoring stations not in the UK's Automatic Urban and Rural Network have been used as an independent check on the performance of model outputs. These verification data have been sourced from AEA Energy & Environment's Calibration Club customers and ad-hoc monitoring campaigns. These data are ratified to the same standard as data from the UK national networks and are widely regarded as high quality and reliable. Monitoring stations used in this verification process are presented in Table A2.1 of Appendix 2.

## 2 Mapping Methods

This section of the report presents the methods used to map ozone throughout the UK. Following recommendations made by a study comparing the relative performance of the available techniques for modelling ozone within the UK<sup>7</sup>, an empirical mapping approach has been used for predicting ozone concentrations in 2006.

The empirical approaches draw upon measurements from the 92 monitoring stations in the AURN to produce functions describing ground-level ozone based upon wind velocity, topography and local emissions of NOx. These functions are capable of predicting ozone levels at a resolution of 1 x 1 km<sup>2</sup> and the methods are briefly described in the following sections; full details can be sourced from the cited references. The methods used here are based upon those presented by Coyle et al<sup>8</sup>, NEGTAP<sup>9</sup> and PORG<sup>10</sup>.

### 2.1 MODELLING THE NUMBER OF DAYS EXCEEDING 120 µg m<sup>-3</sup> METRIC

#### 2.1.1 Days greater than 120 µg m<sup>-3</sup> methodology

At rural locations in the UK exceedences of 120 µg m<sup>-3</sup> as a maximum daily 8-hour mean are broadly consistent over wide spatial scales. As a result, measured exceedences from rural monitoring stations have been interpolated throughout the whole UK to represent the likely exceedences of this metric in the absence of NOx titration effect arising from emissions of NOx from combustion sources.

The resultant interpolated maps, however, will overestimate exceedences in urban areas, where nitric oxide emissions from combustion sources deplete ozone concentrations. This effect has been accounted for by subtracting an empirically derived urban ozone decrement expressed as a percentage. The percentage decrement is defined as follows:

$$\% \text{ decrement} = 100 * ( (\text{measured concentrations} - \text{rural interpolated concentration}) / \text{rural interpolated concentration})$$

The derivation of a coefficient relating the percentage decrement to the modelled local NOx concentration<sup>11</sup> is shown in Figure 2.1 and Figure 2.2.

<sup>10</sup> PORG (UK Photochemical Oxidants Review Group), 1998. Ozone in the UK. 4th report of the UK Photochemical Oxidants Review Group, 1<sup>st</sup> Edition. The Department of the Environment Transport and the Regions.

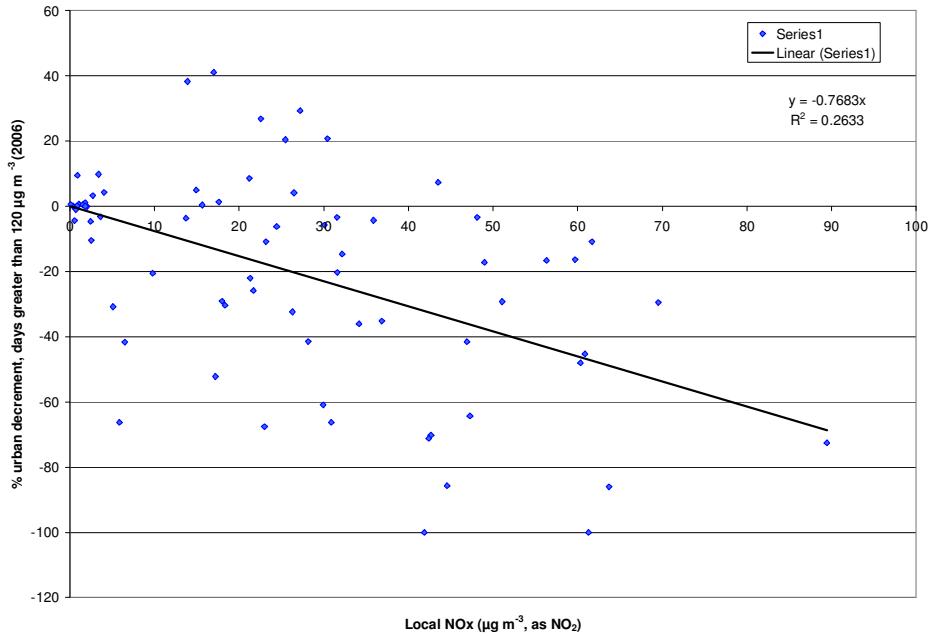

<sup>11</sup> Kent et al (2008). UK air quality modelling for annual reporting 2006 on ambient air quality assessment under Council Directives 96/62/EC, 1999/30/EC and 2000/69/EC. Report to the Department for Environment, Food and Rural Affairs, the Scottish Executive, Welsh Assembly Government and the Department of the Environment in Northern Ireland. AEA Energy & Environment report. AEAT/ENV/R/2502 Issue 1.

This local NOx component is calculated as follows:

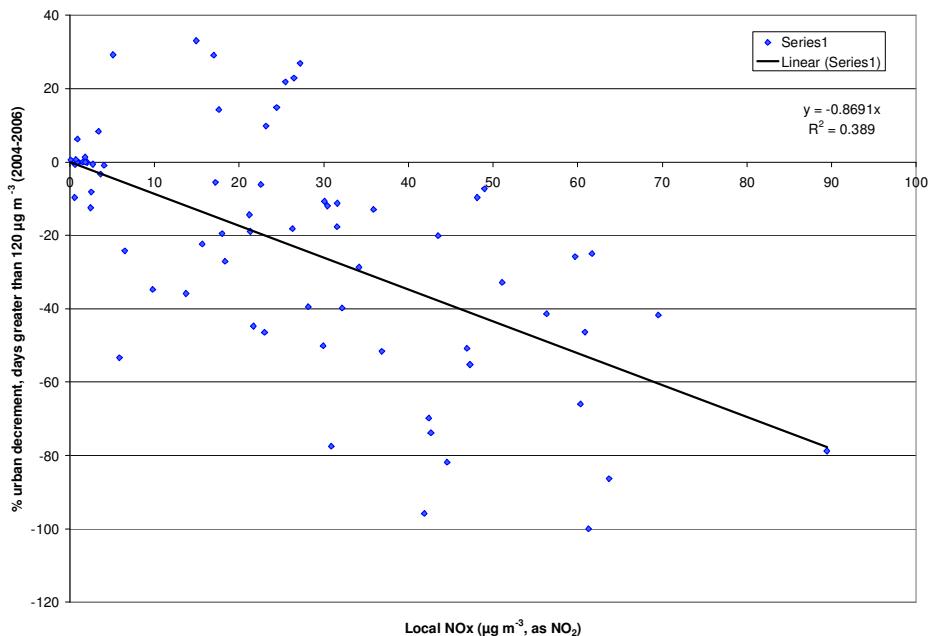

$$\text{Local NOx} = \text{modelled background NOx concentration} - \text{modelled rural NOx concentration}$$

Thus the local NOx concentration is the sum of contributions from local point and area NOx emissions calculated using an air dispersion model. Figure 2.1 shows the decrement plot for days greater than  $120 \mu\text{g m}^{-3}$  in 2006  $\mu\text{g m}^{-3}$  (the LTO for human health metric) and Figure 2.2 shows the decrement plot for days greater than  $120 \mu\text{g m}^{-3}$  between 2004 and 2006 (the TV for human health metric).

**Figure 2.1 Days greater than  $120 \mu\text{g m}^{-3}$  percentage decrement in ozone concentrations, 2006**

**Figure 2.2 Days greater than  $120 \mu\text{g m}^{-3}$  percentage decrement in ozone concentrations representing UI, 2004-2006**

The calculated decrement is then used to correct the interpolated rural days above 120  $\mu\text{g m}^{-3}$  maps:

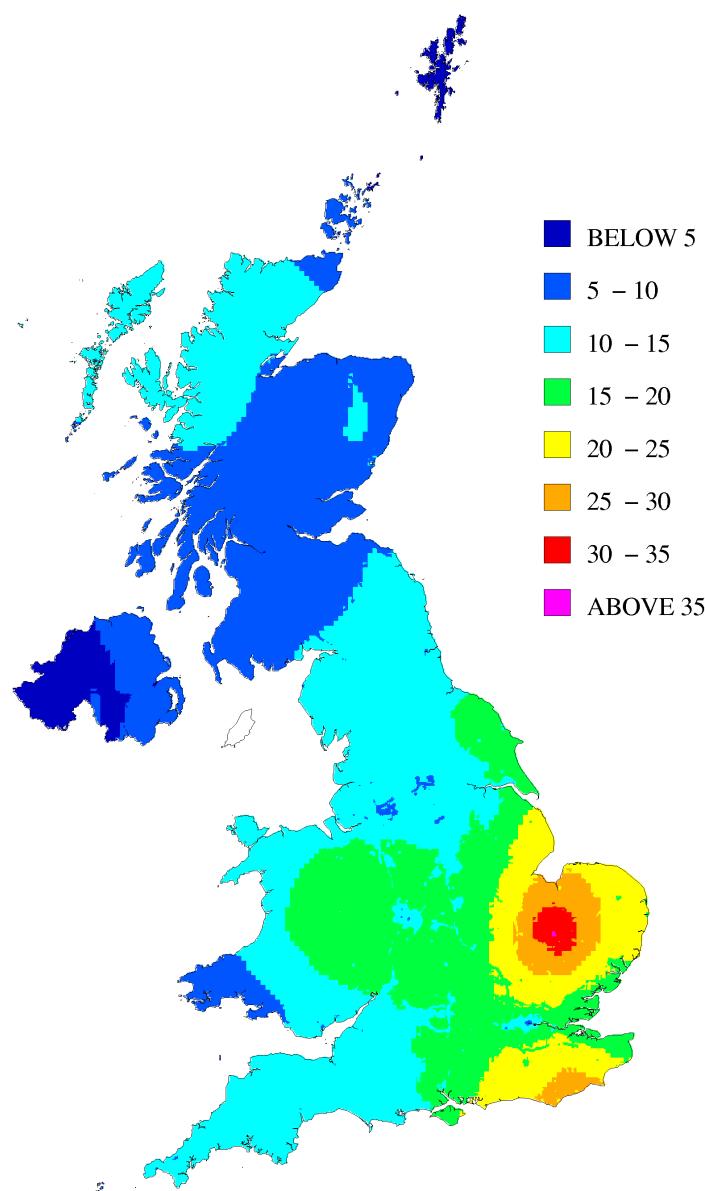

$$\text{Corrected days above } 120 \mu\text{g m}^{-3} \text{ map} = \text{interpolated rural map} + \text{decrement}$$

The decrement is a negative value and so reduces the concentration presented in the interpolated rural map to account for titration of ozone due to NOx concentrations. Where the product of the expression above results in a predicted number of days exceeding less than 1, the predicted value is rounded to the nearest integer.

Maps of modelled number of days with maximum daily 8-hour mean zone concentrations greater than 120  $\mu\text{g m}^{-3}$  for comparison with the Long Term Objective (2006) and Target Value (averaged 2004 to 2006) are presented in Figures 2.3 and 2.4 respectively.

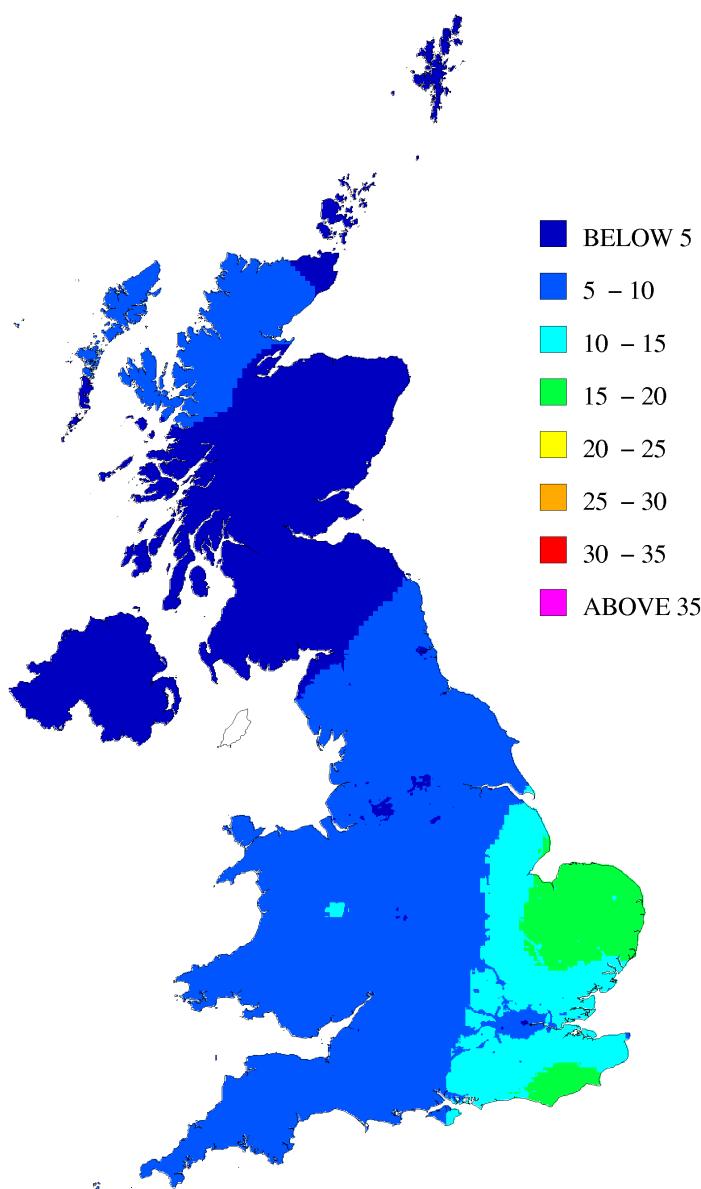

Figures 2.1 and 2.2 show that the relationship between the percentage urban decrement and local NOx concentration. For some monitoring stations the decrement is positive, indicating that the measured number of days exceeding 120  $\mu\text{g m}^{-3}$  is higher than the corresponding estimated rural value i.e. that the urban influence for these sites is not being properly represented in the model. The cluster of low values close to the origin of these plots largely consists of the rural and remote sites at which there will be little difference between the rural estimated number of days exceeding 120  $\mu\text{g m}^{-3}$  and the measured value. This helps to anchor the relationship to the origin. Percentage urban increments of -100% indicate that there were no measured exceedences of 120  $\mu\text{g m}^{-3}$  that monitoring site.

### 2.1.2 Verification of mapped number of days > 120 µg m<sup>-3</sup> values

Figures 2.5 and 2.6 show comparisons of modelled and measured number of days with maximum daily 8-hour mean ozone concentrations greater than 120 µg m<sup>-3</sup> in 2006 and averaged 2004-6 at background locations. Both the national network sites used to calibrate the models and the verification sites are shown. Lines representing  $y = x - 50\%$  and  $y = x + 50\%$  are also shown (this is the AQDD3 data quality objective for modelled ozone concentrations).

**Figure 2.5 Verification of background number of days > 120 µg m<sup>-3</sup> model 2006**

**Figure 2.6 Verification of background number of days > 120 µg m<sup>-3</sup> model 2004 – 2006**

Figures 2.5 and 2.6 illustrate that in general, the models overestimate the number of days greater than 120 µg m<sup>-3</sup> for 2006 and 2004-2006, although for the period 2004-2006 there was a single site (Heathrow LHR2) where the model estimate was lower than the number of days exceeding 120 µg m<sup>-3</sup> measured. Figure 2.6 shows better agreement for the period 2004-2006 with the corresponding measured results although there is a slight over prediction at the lower end of the scale.

Summary statistics for the comparison of modelled and measured ozone concentrations are listed in Table 2.1. These data show that on average there is good agreement between the modelled and measured data, although there is some degree of scatter in the model predictions.

**Table 2.1 Summary statistics for comparison between modelled and measured number of days exceeding 120 µg m<sup>-3</sup> as a maximum daily 8-hour mean**

		Mean of measurements (days)	Mean of model estimates (days)	r <sup>2</sup>	% outside data quality objectives	No. sites
<b>National Network</b>	2006	13.1	12.8	0.68	6	72

### **2.1.3 Detailed comparison of model results with Target Values and Long-term Objectives**

The modelling results, in terms of a comparison of modelled concentrations with the Target Value and Long-term Objective, by zone, are summarised in Table 2.2. These data have also been presented in Form 19g of the questionnaire. Method B in this table refers to the modelling method described in this report.

Estimates of area and population exposed have been derived from the background maps only.

**Table 2.2 Tabular results of and methods used for supplementary assessment (1999/30/EC Article 7(3) and Annex VII(II), 2000/69/EC Article 5(3) and Annex VI(II) and 2002/3/EC Article 9(1) and Annex VII(II))**

## 2.2 MODELLING THE AOT40 VEGETATION METRIC

### 2.2.1 AOT40 methodology

Annex I of the Directive describes AOT40 (expressed in  $(\mu\text{g m}^{-3}) \cdot \text{hours}$ ) as the sum of the difference between hourly concentrations greater than  $80 \mu\text{g m}^{-3}$  ( $= 40$  parts per billion) and  $80 \mu\text{g m}^{-3}$  over a given period using only the 1 hour values measured between 8:00 and 20:00 Central European Time each day May to July.

The AOT40 vegetation metrics for 2006 and the averaged metric 2002-2006 were calculated from measured data at rural monitoring stations in the AURN during the “well-mixed” period of the day (hours 1200 UTC to 1800 UTC). These data were interpolated to produce a rural well-mixed map at 1 x 1 km<sup>2</sup> resolution. Topographic effects are important for some ozone metrics, such as the AOT40 because of the disconnection of a shallow boundary layer from air aloft at times other than during the middle of the day at lowland locations. Surface ozone concentrations are lower at times other than during the middle of the day in these locations due to a combination of dry deposition and titration with NO emissions. This effect is much less marked at higher altitudes and at coastal locations, where wind is generally stronger and a shallow boundary layer does not form. As a result of the influence of altitude on this metric, it is necessary to calculate the metric between these well-mixed hours to allow an appropriate correction to the interpolated well-mixed rural map. This correction accounts for the diurnal variation in ozone, thereby converting the mapped well-mixed AOT40 to a daily AOT40 for comparison against the Directive. The correction uses a variable  $\Delta O_3$ , where  $\Delta O_3$  describes the difference between the AOT40 “well-mixed” and that between 0800 UTC and 2000 UTC during 2006<sup>12</sup>. For the purposes of this study the components of  $\Delta O_3$  are described as follows and were derived from measured values in 2006 for the single year metric and years 2002-2006 for the multi-year metric:

$$\Delta O_3 \text{ 2006} = 0.0003 \cdot \text{altitude} + 1.385$$

$$\Delta O_3 \text{ 2002-6} = 0.0003 \cdot \text{altitude} + 1.344$$

An urban decrement term was subsequently defined for monitoring stations in the AURN and the rural map to correct for the depletion of ozone in areas close to sources of NO. As for the days above 120  $\mu\text{g m}^{-3}$  metric, the decrement is closely related to annual mean NOx concentration, and has been defined in a similar fashion, using a percentage decrement in ozone concentrations associated with NOx concentrations. The relationships between the decrement and modelled NOx concentrations for 2006 and 2002-2006 averaged metrics are presented in Figures 2.7 and 2.8 below.

Using the same methodology discussed in Section 2.1 for the days greater than 120  $\mu\text{g m}^{-3}$  maps, the decrement was then used to correct the final AOT40 maps:

$$\text{Corrected AOT40 map} = \text{interpolated rural map} + \text{decrement}$$

Maps of modelled AOT40 for comparison with the Long-term Objective (2006) and Target Value (averaged 2002 to 2006) are presented in Figures 2.9 and 2.10.

## 2.2.2 Verification of mapped AOT40 values

Figures 2.11 and 2.12 show comparisons of modelled and measured AOT40 metrics in 2006 and averaged 2002-6 at background locations. Both the national network sites used to calibrate the models and the verification sites are shown. Lines representing  $y = x - 50\%$  and  $y = x + 50\%$  are also shown (this is the AQDD3 data quality objective for modelled ozone concentrations).

**Figure 2.11 Verification of background AOT40 vegetation model, 2006**

**Figure 2.12 Verification of background AOT40 vegetation model, 2002-2006**

Both Figures 2.11 and 2.12 show some over prediction by the models in the lower ranges. This is more prevalent in the AOT40 for 2006 than the 2002-2006 averaged AOT40 metric due to the averaging nature of the multi-year metric. These sites are generally urban sites for which model performance is not optimum.

Summary statistics for the comparison between modelled and measured ozone concentrations are listed in Table 2.3. As for the modelled days above  $120 \mu\text{g m}^{-3}$  metric, Table 2.3 indicates that on average the modelled and measured data compare well although the scatter in the relationship is large.

**Table 2.3 Summary statistics for comparison between modelled and measured AOT40 vegetation metric**

		Mean of measurements ( $\mu\text{g.hours}$ )	Mean of model estimates ( $\mu\text{g.hours}$ )	$r^2$	% outside data quality objectives	No. sites

Verification Sites	2002-6	6232	6252	0.35	11	19

### 2.2.3 Detailed comparison of modelling results with limit values

The modelling results, in terms of a comparison of modelled concentrations with the Long-term Objective and the Target Value by zone, are summarised in Table 2.4. These data have also been presented in form 19g of the questionnaire. Method B in this table refers to the modelling method described in this report.

Estimates of area and population exposed have been derived from the background maps only.

**Table 2.4 Tabular results of and methods used for supplementary assessment (1999/30/EC Article 7(3) and Annex VII(II), 2000/69/EC Article 5(3) and Annex VI(II) and 2002/3/EC Article 9(1) and Annex VII(II))**

### 3 Exceedence of the Target Value and Long-term Objective

#### 3.1 RESULTS FOR UK IN 2006

Table 3.1 presented in this section is derived from Form 9 of the questionnaire. Exceedence (or otherwise) of the Target Value (TV) and Long-term Objective (LTO) where this exists are indicated by a 'y' for measured exceedences and with an 'm' for modelled exceedences. If both measurements and model estimates show that a threshold has been exceeded then the measurements are regarded as the primary basis for compliance status and 'y' is therefore used. An 'm' in the columns marked >TV, ≤TV; >LTO indicates that modelled concentrations were higher than measured concentrations or on rare occasions that measurements were not available for that zone and modelled values were therefore used. Modelled concentrations may be higher than measured concentrations because the modelling studies provide estimates of concentrations over the entire zone. It is possible that the locations of the monitoring sites do not correspond to the location of the highest concentration in the zone. An 'm' in the columns marked ≤LTO indicates that measurements were not available for that zone and modelled values were therefore used.

The results are summarised in Tables 3.2 and 3.3 in terms of exceedences of Target Values (TV) and Long-term Objectives (LTO).

**Table 3.1 - Form 9 List of zones and agglomerations in the UK where levels exceed or do not exceed Target Values or Long-term Objective**

## 3.2 MEASURED EXCEEDENCES IN UK IN 2006

Forms 13a-c of the questionnaire requires reasons associated with the measured exceedences of the LTO, Alert Threshold and Information Threshold to be documented. This information is summarised in Tables 3.4 to 3.6 for monitoring stations in the UK at which exceedences of the LTO, Alert and Information Thresholds were measured. Measured annual statistics for ozone are presented in Form 15 of the questionnaire (see Table 3.7). Forms 14a-b relates to measured exceedence of the TVs of which there are none (see Table 3.2).

The Reason Code 'S10' refers to the 'Transport of air pollution originating from sources outside the Member State'.

### 3.3 RESULTS FOR GIBRALTAR IN 2006

A comparable air quality assessment for ozone is carried out for Gibraltar just as for the rest of the UK and is submitted to the European Commission in a separate questionnaire. The results of this assessment are presented in this section, summarising concentrations in 2006 and including Tables from the submitted questionnaire for Gibraltar. The results for Gibraltar have been based on measured data from the continuous automatic monitoring campaign, no model outputs being available for Gibraltar at this time.

Table 3.8 presented below is from Form 9 of the questionnaire. Exceedence (or otherwise) of the Target Value (TV) and Long-term Objective (LTO) where this exists are indicated by a 'y' for measured exceedences and with an 'm' for modelled exceedences. If both measurements and model estimates show that a threshold has been exceeded then the measurements are regarded as the primary basis for compliance status and 'y' is therefore used. An 'm' in the columns marked  $>TV$ ,  $\leq TV$ ;  $>LTO$  indicates that modelled concentrations were higher than measured concentrations or on rare occasions that measurements were not available for that zone and modelled values were therefore used. Modelled concentration may be higher than measured concentrations because the modelling studies provide estimates of concentrations over the entire zone. It is possible that the locations of the monitoring sites do not correspond to the location of the highest concentration in the zone. An 'm' in the columns marked  $\leq LTO$  indicates that measurements were not available for that zone and modelled values were therefore used.

The results for Gibraltar are summarised in Tables 3.9 and 3.10 in terms of exceedences of Target Values (TV) and Long-term Objectives (LTO).

**Table 3.8 - Form 9 List of zones and agglomerations in Gibraltar where levels exceed or do not exceed Target Values or Long-term Objective**

Zone	Zone code	Thresholds for health			Thresholds for vegetation		
		$>TV$	$\leq TV$ ; $>LTO$	$\leq LTO$	$>TV$	$\leq TV$ ; $>LTO$	$\leq LTO$
Gibraltar	UK(GIB)		y			y	

**Table 3.9 - Summary results of air quality assessment relative to the Target Values for ozone for 2010**

Target Value	Number of zones exceeding
Max Daily 8-hour mean Target Value	none
AOT40 Target Value	none

**Table 3.10 - Summary results of air quality assessment relative to the Long-term Objectives for ozone**

Long-term Objective	Number of zones exceeding
Max Daily 8-hour mean Long-term Objective	1 zone (measured)
AOT40 Long-term Objective	1 zone (measured)

### 3.4 MEASURED EXCEEDENCES IN GIBRALTAR IN 2006

Forms 13a-c of the questionnaire require reasons associated with the measured exceedences of the LTO, Alert Threshold and Information Threshold to be documented. Available monitoring data shows that neither the Alert Threshold or the Information Threshold were exceeded in Gibraltar in 2006. There were measured exceedences of the LTO in Gibraltar in 2006, the details of which are presented in Table 3.11. Measured annual statistics for ozone are presented in Form 15 of the questionnaire (see Table 3.12). Forms 14a-b relates to measured exceedence of the TVs of which there are none (see Table 3.9).

The Reason Code 'S10' refers to the 'Transport of air pollution originating from sources outside the Member State'.

**Table 3.11 - Form 13c Individual exceedences of ozone thresholds (2002/3/EC, Article 10(2b) and Annex III)**

## 4 Acknowledgements

This work was funded by the UK Department for Environment, Food and Rural Affairs, Welsh Assembly Government, the Scottish Executive, the Department of the Environment in Northern Ireland and the Government of Gibraltar. Permission to include monitoring data and detailed information on site locations for the verification sites were kindly provided by the Local Authorities and companies listed in Table A2.1 in Appendix 2. The authors would also like to thank CEH Edinburgh for providing information upon mapping days exceeding and AOT40 metrics.

## APPENDIX 2. MONITORING SITES USED TO VERIFY THE MAPPED ESTIMATES

**Table A2.1. Monitoring sites used to verify the mapped estimates**

Site	Site Type	Authority
Abingdon	URBAN BACKGROUND	Vale of White Horse DC
Basingstoke Eastrop	URBAN BACKGROUND	Basingstoke & Deane DC
Birmingham Airport	AIRPORT	Birmingham International Airport
Bracknell Foxhill	URBAN BACKGROUND	Bracknell Forest BC
Cardiff Briardene	URBAN BACKGROUND	Cardiff City Council
Folkestone	SUBURBAN	Kent & Medway Air Quality Monitoring Network
Glasgow Waulkmillglen Reservoir	RURAL	Glasgow City Council
Heathrow LHR2	AIRPORT	BAA
Heathrow Main Road	AIRPORT	BAA
Heathrow Oaks Road	AIRPORT	BAA
London Ealing Town Hall	URBAN BACKGROUND	London Air Quality Network
London Hounslow Cranford HS2	URBAN BACKGROUND	London Air Quality Network
Luton Background	URBAN BACKGROUND	Kent & Medway Air Quality Monitoring Network
Maidstone Rural	RURAL	Kent & Medway Air Quality Monitoring Network
Marchlyn Mawr	REMOTE	Gwyneth Council
Newham Wren Close	URBAN BACKGROUND	London Borough of Newham
Newport Malpas Depot	URBAN BACKGROUND	Newport County BC
Oldham West End House	URBAN BACKGROUND	Oldham MBC
Oxford St Ebbes	URBAN BACKGROUND	Oxford City Council
South Holland	RURAL	South Holland DC
Tameside Two Trees School	URBAN BACKGROUND	Tameside MBC
Thanet Rural	RURAL	Kent & Medway Air Quality Monitoring Network
V Glamorgan Fonmon	RURAL	Vale of Glamorgan Council
