# Air Pollution Forecasting: Ozone Pollution Episode Report (June-July 2005)

Jaume Targa, netcen 08/08/2005 updated 24/11/2005

#### INTRODUCTION

HIGH levels of air pollution were measured across the Automatic Urban and Rural Network (AURN) during June 2005. These were concentrated in the South East area and Greater London. The AURN recorded ozone levels in index 7 of the Defra HIGH band (90-119 ppb, 180-239  $\mu gm^{-3}$ ) at seven stations. The highest hourly concentration during June was 202  $\mu gm^{-3}$  (index 7), which occurred at Weybourne at 19.00 on the 24<sup>th</sup> June. High levels of ozone were measured during 5 consecutive hours at Weybourne between 18.00 and 23.00. In July, there was a period of elevated  $\rm O_3$  levels between 9<sup>th</sup> and 17<sup>th</sup>. However, the levels rarely reached MODERATE index 5.

The  $3^{\text{rd}}$  Daughter Directive (Directive 2002/3/EC) on ozone in ambient air established an alert threshold of 240  $\mu\text{gm}^{-3}$  as an hourly average over three consecutive hours. This alert threshold was not exceeded, during June-July 2005.

#### **DEFINING THE EPISODE**

The episode reported in this report covers the period between  $19^{th}$  and  $24^{th}$  of June. During this, seven stations in the AURN measured at least one hourly average above  $180~\mu gm^{-3}$ . Summer ozone episodes can be hard to delimit because ozone levels are often in the MODERATE band during the summer season. Although the period has been identified in June, this report covers the period between  $18^{th}$  June and  $18^{th}$  July 2005.

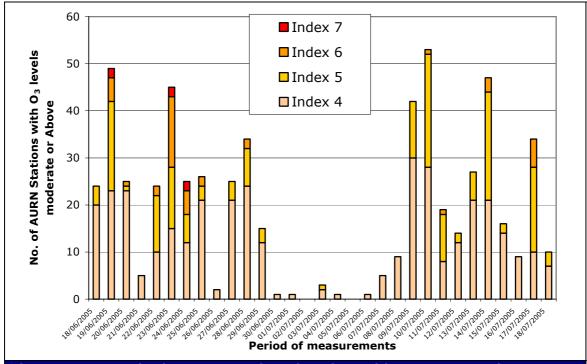

Figure 1. Ozone Episode Days – Number of Stations with MODERATE and HIGH levels between 18<sup>th</sup> June and 18<sup>th</sup> July 2005.

As can be seen in figure 1, the episode started on  $19^{th}$  June, when more than 47 stations measured MODERATE levels of  $O_3$  and 2 stations measured HIGH levels (index 7). The episode ended on  $24^{th}$  June, when only 23 stations measured levels in the MODERATE band and 2 stations measured HIGH levels (index 7). Although  $O_3$  levels did not reach HIGH levels between the  $9^{th}$  and  $17^{th}$  of July, this period is also investigated in this report. During this second period, highest levels were measured in Wicken Fen at  $172\,\mu\text{gm}^{-3}$  (index 6) on the  $14^{th}$  July.

#### THE OZONE EPISODE

During the episode, 7 stations in the AURN recorded HIGH levels of ozone. The highest hourly ozone concentration measured was 202  $\mu gm^{-3}$  at Weybourne on  $24^{th}$  June. Sibton also measured HIGH levels on this date. Three stations measured HIGH levels on  $19^{th}$  June: Weybourne, St Osyth and Bournemouth. On 23th of June, three stations again measured HIGH levels of ozone: Sibton, London Eltham and Lullington Heath. These are shown in table 1 and figure 2. The episode reported here covers the period between the  $19^{th}$  and the  $24^{th}$  of June. 2005.

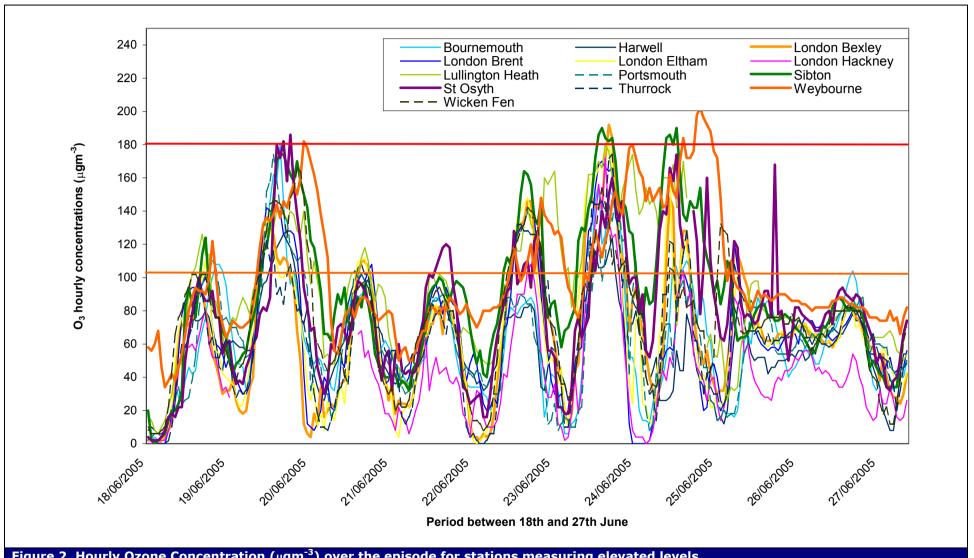

Figure 2. Hourly Ozone Concentration (μgm<sup>-3</sup>) over the episode for stations measuring elevated levels.

#### REASONS FOR THE EPISODE

The summer ozone episode was characterised by rising temperatures and air masses recirculating over northern Europe and the UK. These conditions typically result in summer smog episodes as the ozone precursor chemicals react in the presence of sunlight. These are typical summer situations previously reported in Targa (2004) and Kent (2003).

It is important that both high temperatures and re-circulation of air masses over Europe and the UK are coupled together to result in a summer smog episode as discussed below.

## **Temperature**

The report focuses on two periods of high ambient temperatures in the UK:

- 18<sup>th</sup> to 14<sup>th</sup> June (referred as first period)
- 10<sup>th</sup> to 15<sup>th</sup> July (referred as second period)

During the first period, maximum temperatures reached *circa* 35°C with a daily average *circa* 26°C as can been seen in Figure 3 These temperatures were measured in the South East. During the second period, maximum temperatures reached 29°C with a daily average circa 24°C. Although slightly lower, as can be seen in figure 3, both periods follow similar trends in temperatures with two higher peaks on the second and sixth day.

As shown in figure 3, only the first period of high temperatures resulted in HIGH levels of ozone. These were particularly important on  $19^{th}$ ,  $23^{rd}$  and  $24^{th}$  June 2005. Apart from high temperatures the re-circulation of air masses of Europe and the UK were particularly important on those days (see following section).

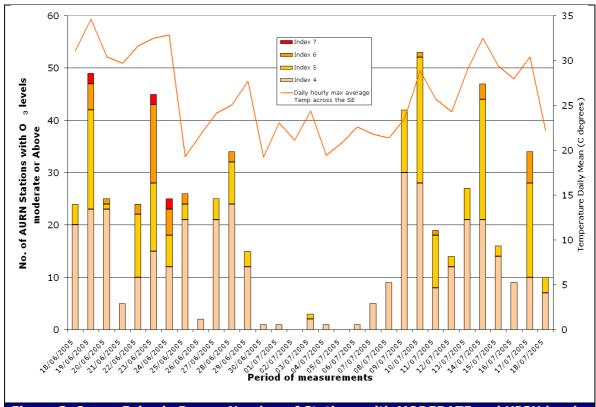

Figure 3. Ozone Episode Days – Number of Stations with MODERATE and HIGH levels between 18<sup>th</sup> June and 18<sup>th</sup> July 2005 with temperature profile across the South East.

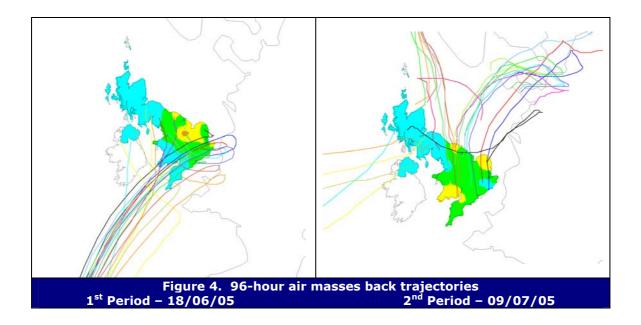

#### Re-circulation of air masses

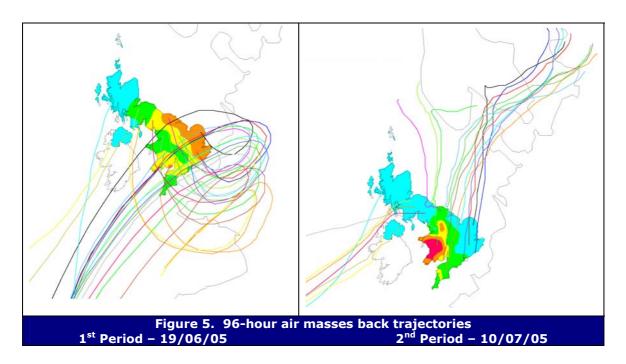

Figures 4-10 show the 96 hours airmass back-trajectories on the two periods of high temperatures between June and July. Each figure shows one back-trajectory from the first period and one for the second period. Although temperatures were a little higher in the first period, the back trajectories have been coupled to see the difference between both periods,

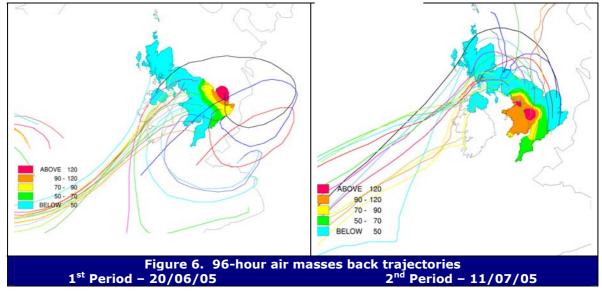

which resulted in Defra's HIGH levels of ozone measured in the first period (particularly the  $19^{th}$ ,  $23^{th}$  and  $24^{th}$  June).

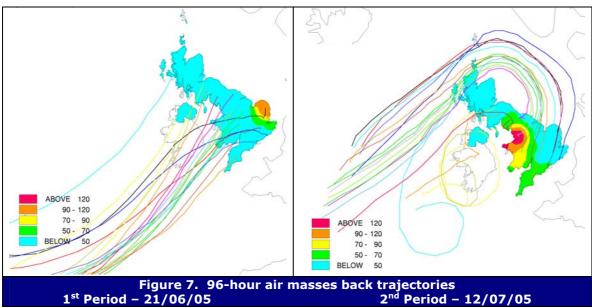

Figure 5, 9 and 10 show the importance of air masses re-circulating over Europe - and then over the UK – in reaching HIGH levels of ozone on the  $19^{th}$ ,  $23^{rd}$  and  $24^{th}$  June. For the second period, despite the high temperatures, clean air masses originating in Scandinavia or in the Atlantic prevented ozone levels reaching HIGH levels. On the  $10^{th}$ ,  $14^{th}$  and  $15^{th}$  July, ozone levels hardly reached Defra's MODERATE (index 6).

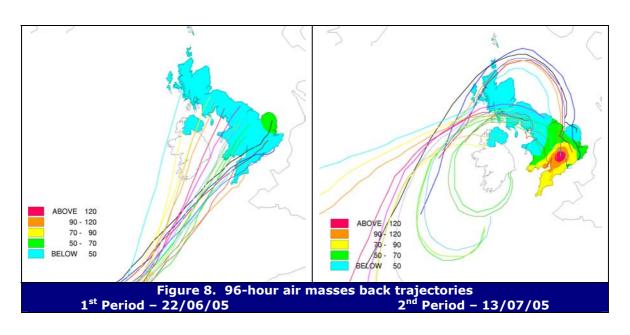

This re-circulation, in conjunction with high temperatures and UK ozone precursor emissions (specially over Greater London Urban Area), was the main reason for ozone levels reaching Defra's HIGH band.

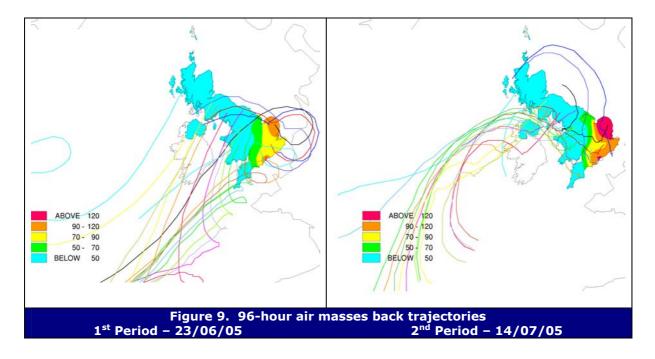

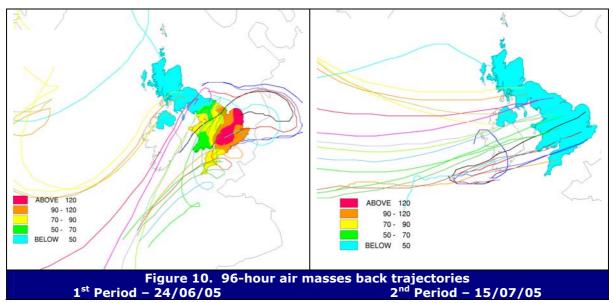

### **EPISODE ACROSS LOCAL NETWORKS**

The ozone episode was also measured across three local networks in the South East: Kent Air Quality Network, London Air Quality Network (LAQN) and the Herts. & Beds. Air Pollution Monitoring Network (BAPMN).

As can be seen in Table 2, the highest hourly average was measured at Sevenoaks 2 Urban Background (UB) station at 195 on the 24<sup>th</sup> June.

HIGH levels of  $O_3$  were measured at Sevenoaks 2 UB and Greenwich 4 stations on the  $23^{rd}$  June, at Sevenoaks 2 UB, Bromley 4, Luton Background (UB) and Folkestone Suburban on the  $24^{th}$  June and at Mid Beds Silsoe (Rural) on the  $14^{th}$  July.

Table 2. Defra's HIGH O<sub>3</sub> levels measured across Local Networks in the South East

Station Name	Туре	Network	Date & hour	O <sub>3</sub> Hourly average (μgm <sup>-3</sup> ) provisional
Sevenoaks 2 - Greatness	Urban Background	Kent AQN	24/06/2005 11:00	195
Luton Background	Urban Background	Kent AQN	24/06/2005 11:00	189
Luton Background	Urban Background	Kent AQN	24/06/2005 10:00	187
Mid Beds Silsoe	Rural	HBAPMN	14/07/2005 16:00	185
Folkestone Surburban	Suburban	Kent AQN	24/06/2005 17:00	184
Bromley 5 – Biggin Hill	Suburban	LAQN	24/06/2005	184
Sevenoaks 2 - Greatness	Urban Background	Kent AQN	23/06/2005 16:00	183
Greenwich 4 - Eltham	Urban Background	LAQN	23/06/2005	180

#### **EPISODE ACROSS EUROPE**

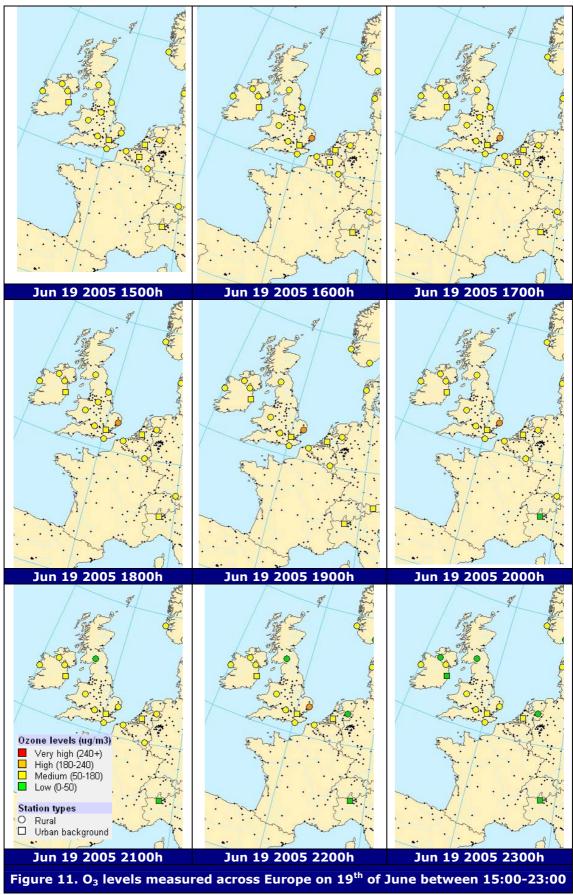

The ozone episode on the 23<sup>rd</sup> and 24<sup>th</sup> of June was measured in Belgium and the Netherlands<sup>1</sup>. Figures 11 to.15 show the following sequence of hourly ozone measurements in the UK, Belgium and the Netherlands (note that this data is provisional):

- 19<sup>th</sup> June between 15:00 and 23:00,
- 23<sup>rd</sup> June between 12:00 and 23:00 and
- 24<sup>th</sup> June between 09:00 and 23:00

The episode on the  $19^{th}$  June was only measured in the UK (South East England) while the  $23^{rd}$  and  $24^{th}$  affected both Europe and the UK.

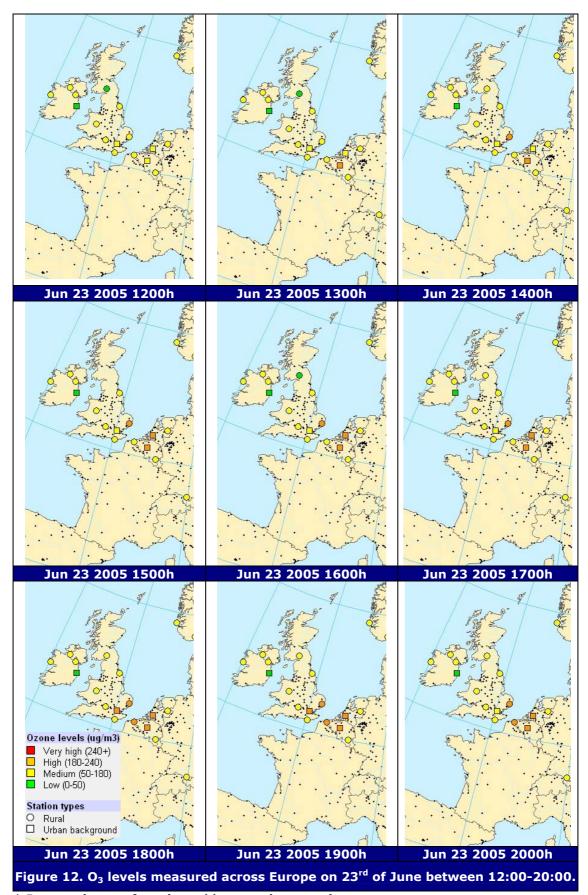

The re-circulation of air masses between the UK and Europe presented in figure 4 and 10, in conjunction with high temperatures across the UK and Europe explain the reason for this transboundary episode.

# **SUMMARY**

The main features of the June/July 2005 ozone episode may be summarised as follows:

- High summer temperatures and re-circulating air over Europe and the UK resulted in the first prolonged ozone episode of 2005 (in June).
- The June episode was also measured across Europe in Belgium and the Netherlands.
- High summer temperatures in July did not result in HIGH levels of ozone due to the lack of re-circulation of air over Europe or the UK.
- The area affected by the June episode was limited to the south east England and Greater London.
- Changes of airmass back trajectories brought the episode to an end as clean air arrived from the Atlantic
- The highest hourly average ozone concentration recording during the episode was  $202 \ \mu gm^{-3}$  (index 7), which occurred at Weybourne on  $24^{th}$  June.
- Measured ozone levels during the June episode did not exceed the Directive 2002/3/EC alert threshold of 240  $\mu \mathrm{gm}^{-3}$  (120 ppb) as an hourly average over three consecutive hours.
